What are equities?

When you buy stocks or shares of a company you're basically becoming a part-owner in that company – investing your money in the stock market for a fractional ownership of that business. This fractional ownership is known as equity.

Impact of investing in stocks

By becoming a part-owner and taking equity in a company, you are now entitled to a share of any profits or growth enjoyed by the business. It also means you share risks that come with investing, such as the risk that the value of your investment may decline.

Since the stock market allows investors to purchase pieces of ownership, or equity interest, in the form of stocks, the term equity and stock are interchangeable, with both being used to refer to the equity interest investors take in publicly held companies.

Common equity terms

Common shares

When people talk about stocks, they are usually referring to common shares. These shares represent ownership in a company and a claim, usually in the form of dividends (if any), on a portion of the company's profits. A shareholder is also given voting rights regarding company matters.

Preferred shares

Preferred shares represent part ownership in a company, but don't usually come with the same voting rights as common shares. The trade-off is that preferred shareholders are ranked higher than common shareholders in the event that the company runs into financial difficulty.

Small cap/mid cap/large cap

Market capitalization is the market value of a company's outstanding shares. To calculate a company's market capitalization, multiply its current share price by the number of outstanding shares. A company with a relatively small market capitalization (commonly less than \$2 billion) is defined as a small-cap company. As a general rule, small-cap companies offer investors more opportunity for growth, but also more risk and volatility. A mid-cap company has a market capitalization between \$2 and \$10 billion, while a large-cap company typically has a market capitalization above \$10 billion.

Developed market

Developed market countries are the world's most advanced economically and offer investors high levels of liquidity, large capitalization and well-established, effective market regulations. As a result, these markets are typically open for business, which means any investor anywhere can participate in their equity market. Developed markets are found mostly in North America, Western Europe and Australasia.

Emerging market

An emerging market is a country that is in the process of rapid growth and development. Typically, these countries have lower per-capita incomes and less mature (and sometimes less regulated) capital markets. Examples include Brazil, Russia, India and China. Emerging markets offer attractive investment opportunities because of their growth potential, but they are also riskier than developed markets because they are not as established.

What are bonds?

Think of bonds as formalized, marketable and tradable versions of an “IOU.” When a company or government wants to raise money, they will issue a debt instrument known as a bond. Each investor gets a chance to lend a portion of the capital required by purchasing these fixed-income securities. In return for loaning a portion of the money, each investor is promised the return of their initial loan, plus pre-determined annual or semi-annual interest payments based on the initial loan amount. A bondholder can also earn a profit by reselling a bond in the marketplace if the current price is higher than the purchase price.

Common bond types

Government bonds

Bonds issued by governments (e.g., federal, provincial/state, municipal) are typically considered as higher quality than bonds issued by companies, since governments are usually more creditworthy.

Corporate bonds

A company will issue bonds to raise capital. Generally, a short-term corporate bond has a maturity of less than five years, while long-term bonds mature in 12 or more years.

High-yield corporate bonds

This type of corporate bond offers a higher rate of interest than investment-grade bonds, as a way to entice investors because of its higher risk of default (i.e., failure to make timely interest or principal payments). In general, higher default risk means higher interest payments.

Investment-grade corporate bonds

Investment grade refers to the higher quality of a company's credit. When a company issues debt securities, these bonds are given a credit rating based on their default risk. The idea is that a better credit rating identifies safer investments.

What are mutual funds?

Mutual funds are pooled investments that allow a large number of individual investors to purchase a piece of a fund, known as a unit. The money collected from all the investors is used by a professional fund manager to purchase and sell stocks, bonds or other types of securities in accordance with the mutual fund's investment objectives and risk profile.

At the fundamental level there are three fund types: equity funds that invest primarily in stocks, fixed income funds that invest primarily in bonds, and money market funds that invest in short-term debt like Treasury bills. Others still, such as funds that specialize in Responsible Investing (RI), focus on good corporate governance, as well as the social and environmental impacts of a company, thereby uncovering risks that traditional funds have trouble identifying. Within each type of fund there are further specializations. Some funds focus on specific sectors like technology or mining, some on geographical areas like Europe or Asia, some concentrate on types of investments like corporate bonds, while others offer a more balanced approach by offering a mix of equities and bonds.

Growing wealth through mutual fund investing

There are two ways to make money on a mutual fund investment. The first is through distributions. Depending on the type of fund, you may receive earnings in the form of dividends, interest, capital gains or other income. The more units you buy, the larger your share of ownership in that fund and the greater portion of earnings you receive. You can also earn money if you sell your fund investment for more than you paid. This type of profit is known as a capital gain.

Mutual funds allow investors to benefit from a well-diversified investment portfolio that they couldn't create themselves.

All about mutual fund fees

Mutual funds offer a number of benefits, including investment diversification and professional management, but there are costs associated with operating a fund. Generally, most mutual funds incur three types of costs: a management fee, administration fee and taxes – which combine and represent the Management Expense Ratio (MER).

Management and administration fees capture the costs of running a mutual fund, which includes the portfolio management team that sets the fund's strategy, evaluates opportunities and monitors the portfolio. There are also costs for buying and selling securities, recordkeeping, administration, compliance, audit, legal services and custodial services.

An example of mutual fund fees

Advisors provide value for the fees they earn

Fees are paid to the dealer of the company where your financial advisor is registered. Dealers keep detailed client records and produce account statements, while advisors may create financial plans, execute investment transactions on your behalf and continually upgrade professional competency to offer you the best financial advice possible.

Taxes (i.e., GST, HST) are charged on all related fees and services. It's important to review a fund's fees and expenses as these costs will impact the return you get on your investment.

What are multi-asset solutions?

Often referred to as “one-stop” investments, multi-asset solutions are portfolios of mutual funds, and sometimes exchange traded funds, designed to help investors reach their financial goals. They ease the burden of having to research specific investments as well as monitoring your portfolio and making adjustments when required.

Multi-asset solutions cover a wide variety of investing styles, making them effective options for investors with different risk tolerances, financial goals and investment objectives. Despite having many different funds within them, most multi-asset solutions share one or more of the following three goals: to attempt to mitigate exposure to market declines, offer the potential for capital growth and/or provide a sustainable income stream, and the ability to be matched to specific time horizons, risk tolerances and goals.

Benefits of multi-asset solutions

- Professional portfolio management
- Fully diversified portfolios
- Eligible for RRSPs, TFSAs, RESPs and RRIFs, among other account types
- Ongoing monitoring and rebalancing
- Easy way to invest

Sample asset allocation of a multi-asset solution

Taxation of investment income

Different types of investment income are treated differently for tax purposes. For mutual fund investors, the three most likely kinds of income you will receive are interest, dividend and capital gains.

Interest

Interest income (typically paid by bonds and money market securities) is fully taxable at your marginal tax rate.

Capital gains

Capital gains (encountered when you sell an investment at a profit or receive a distribution) are taxed more favourably than interest income, as only 50% of your net gain is taxable at your marginal tax rate.

Dividends

Dividend income is treated differently than interest and capital gains, and a calculator is required to figure out what you owe. The dividend calculation is complex because it protects companies and investors from double taxation. Since dividends are paid with after-tax money, the dividend “gross up” and accompanying tax credit reduce investors’ tax burden. Most mutual fund companies do the calculations for you and provide the necessary tax slips to be used on your income tax return.

Working with an advisor leads to peace of mind and a greater sense of control over your investments.

Benefits of working with a financial advisor

Given that financial markets are becoming more volatile and complex, investors may find it more difficult to invest with confidence, especially if they try doing it on their own.

A comprehensive study by the Securities and Investment Management Association (formerly the Investment Funds Institute of Canada), found significant benefits to the advisor-investor relationship. The study's findings include qualitative (investors feel more confident about their financial situation) and quantitative (investors are in a measurably stronger financial position) insights.

Greater confidence

Working with an advisor leads to peace of mind and a greater sense of control over your investments. This is likely the result of having – and sticking to – a financial plan, being able to measure your success and knowing exactly where you stand in relation to your goals.

Households that receive financial advice (e.g., strategies on how to stay disciplined during times of market volatility) accumulate significantly more assets over time than households that do not receive advice.

Investors who work with a financial advisor accumulated over 15 years more assets than investors without an advisor.*

15 years of financial advice

Benefits of having a financial plan

One of the most important steps you can take to achieve your long-term financial goals is to create a robust financial plan that includes not only your investment goals, but also a complete overview of your financial life, from current net worth to estate goals.

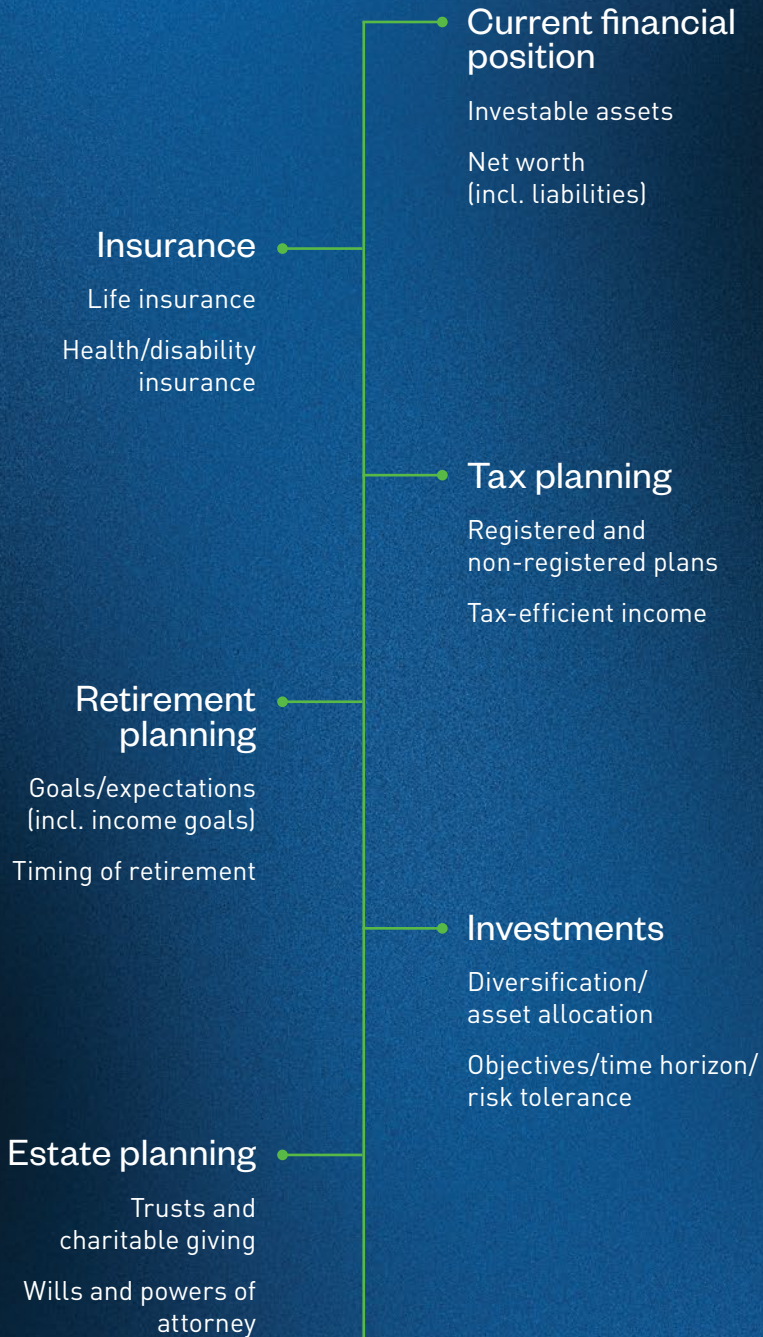

Creating a financial plan is a significant task to take on by yourself, as it will involve both financial and emotional decisions. Seeking a third party (e.g., an advisor) is a good strategy. An advisor can ease the burden of financial calculations and investment selections, and help you stay focused on important decisions.

Find answers to difficult questions

Your financial plan will help you answer important (and sometimes uncomfortable) questions. For example:

- Am I saving enough?
- Am I properly insured?
- Does my investment portfolio match my risk tolerance?
- Will my investment portfolio help adequately fund my retirement?
- Am I currently in a position of financial strength?

Financial planning

The importance of investing early

When it comes to investing, time is on your side. Why? In a word: compounding. While compounding is a straightforward concept – your investments have the potential to grow exponentially as your reinvested interest, dividends and capital gains start to generate their own earnings – it is hard to overstate its impact. Albert Einstein went so far as to call it “the eighth wonder of the world.”

Early investments are more meaningful

In the chart below, you can see how starting early increases the power of compounding.

The blue line shows what would happen if you started investing \$6,500 per year as of today. The green line shows what would happen if you started investing \$13,000 per year in 15 years. In both cases, we’ve assumed a 5% return on your investments.

The value of starting early

Invest with discipline to meet your long-term financial goals

Stock markets are volatile by nature (i.e., values go up and down, sometimes dramatically), and that volatility can lead investors to make reactive decisions based more on emotions than their long-term plan.

Many common mistakes stem from the belief that investors can successfully time the market in order to miss the worst days (the days that the markets drop the most). But a problem quickly arises as investors may easily miss the best days (the days when markets post their biggest gains). What are the results?

Missing the best days

In the example below, someone holding an investment of \$10,000 for the last 30+ years would have a value of \$250,143. However, an investor that missed the market's 10 best days over the same period of time saw their initial investment grow to only \$114,599. Missing additional days in the market continues to have a dramatic impact over the 30 and 60 best days in the market. It's very difficult to know when these best days will occur – that's why staying invested is a core pillar of investing success.

Every day makes a difference

Value of hypothetical \$10,000 investment in the S&P 500 Index from January 1993 to December 2024

Data source: Morningstar. The S&P 500 Index is an American stock market index based on the market capitalizations of 500 large companies having common stock listed on the NYSE or NASDAQ. The S&P 500 Index is unmanaged and unavailable for direct investment.

Easy, regular investing: DCA and PAC

For most of us, it's much easier to find smaller amounts to invest on a regular basis than large, lump-sum contributions. By investing smaller amounts over time, an investment technique known as dollar-cost averaging (DCA), you not only prioritize your savings, you can lower your average investment costs. For instance, when a mutual fund's price is low your money will buy more units; when the price is higher you'll purchase fewer units. Provided the fund gains in value over the long term, you'll profit from your purchases during short-term price declines.

Monthly investment

Month	Monthly investment (\$)	Unit price (\$)	Units purchased
January	100	10	10.00
February	100	9	11.11
March	100	8	12.50
April	100	7	14.29
May	100	6	16.67
June	100	5	20.00
July	100	5	20.00
August	100	6	16.67
September	100	7	14.29
October	100	8	12.50
November	100	9	11.11
December	100	10	10.00
Total	\$1,200		169.14

On December 31 (after one year)

\$1,691.40	Market value of units purchased*
-\$1,200.00	Total cost of purchasing those units
\$ 491.40	Profit

* total units purchased (169.14) x December unit price (\$10)

Unlock the power of DCA with PACs

The simplest way to take advantage of the DCA technique is by setting up a pre-authorized contribution plan (PAC), which automatically transfers a pre-determined amount of money from your bank account and puts it in your designated investment account. You can schedule PACs in a variety of ways, such as weekly, bi-weekly, semi-monthly or monthly, and you get to pick the amount of money that you want to move. Using a PAC to invest is flexible and convenient, and is typically a good way to invest regularly.

Lump sum investment

Month	Monthly investment (\$)	Unit price (\$)	Units purchased
January	1,200	10	120.00
February	0	9	0.00
March	0	8	0.00
April	0	7	0.00
May	0	6	0.00
June	0	5	0.00
July	0	5	0.00
August	0	6	0.00
September	0	7	0.00
October	0	8	0.00
November	0	9	0.00
December	0	10	0.00
Total	\$1,200		120.00

On December 31 (after one year)

\$1,200.00	Market value of units purchased*
-\$1,200.00	Total cost of purchasing those units
\$ 0.00	Profit

* total units purchased (120.00) x December unit price (\$10)

What is diversification and why do you need it?

Let's say you put all your investing dollars into one stock. If it performs well you'll make a lot of money, but if it performs poorly you'll lose a lot. Many investors can't accept that risk, so they follow an investment strategy known as diversification. By putting money in a variety of complementary investments, you reduce the overall risk to your portfolio.

How portfolio diversification works

For diversification to work you would typically construct an investment portfolio that includes several investment categories, such as stocks, bonds and cash, as well as some diversification within categories and geographies. The allocation to each category depends on your investment goals, risk tolerance and time horizon. Spreading your money across several investment options can help improve your return potential while managing volatility (i.e., dramatic movements in the value of your investments).

As a strategy, investment diversification is one of the basic building blocks of a solid, reliable portfolio. It can reduce the number and severity of stomach-churning market declines, while taking advantage of market gains. Mutual funds are a convenient option because they take care of all the diversification decisions and oversight for you.

Challenges in saving for retirement

We often picture retirement as a peaceful time to focus on our passions and pursue our dreams, but even the best retirement plans can face challenges. Fortunately, you can fend off these obstacles by understanding the risks that lie ahead and how they can impact your financial security.

It's no longer unusual for retirees to enjoy 20 or 30 years of post-work living. That can make the possibility of outliving your money a reality, often referred to as longevity risk.

Buying power decreases as inflation increases

Inflation (i.e., rising prices for goods and services) is an ongoing concern. Even at low rates, inflation can erode a person's buying power over time, and for retirees living on a fixed income, this can have serious consequences.

Lower interest rates – which also means less interest paid on bank accounts and guaranteed investment certificates – can also have a negative impact on retirement income. As a result, individuals may need to save more than anticipated, or take on more investment risk, to meet their retirement needs. If your investments were to decline substantially, it could negatively impact your retirement plans. It's often best to work with a financial advisor who can help you prepare well for retirement.

Consider the tax efficiency of your income

Most investors want a steady stream of income from their investments once they retire. The good news is, through disciplined saving and investment, you can grow moderate savings into a large investment portfolio, which translates into annual investment income.

One way to achieve this strategy is through income investing using tax-efficient funds. The key to maximizing this cash-flow strategy is to consider what type of earnings you will receive from your portfolio. For instance, you may want to choose funds that focus more on generating dividends than paying out interest. As the illustration shows, the tax treatment of dividends is much more favourable to investors than interest payments.

Also, some funds make use of return of capital (ROC) for tax efficiency. With ROC, a portion of your own investment is returned to you as part of the fund's distributions, which helps provide steady cash flow while deferring your tax burden on this ROC until you sell your investment.

2024 combined federal and provincial personal income tax rates for Ontario

Taxable income \$	Rate on excess %	Marginal rate on eligible dividend income %
Up to 16,129	–	0.00%

RRSPs and TFSAs as savings vehicles

The Registered Retirement Savings Plan (RRSP) has been around for more than 60 years to help Canadians save for retirement. You might have a workplace plan where your employer makes contributions and may match your voluntary contributions, or maybe you have your own plan. Whatever the case, RRSPs are popular because you receive an immediate tax deduction on your contribution, plus any investment growth is tax-deferred until you begin withdrawing funds.

Consider TFSAs in addition to RRSPs

The Tax-Free Savings Account (TFSA) can be used to save for retirement as well, although many people also use this account to save for shorter-term goals like a home or vehicle. TFSA contributions are made with after-tax dollars, so although you won't receive a tax deduction like the RRSP, all investment growth within the account and any withdrawals are tax-free.

Each plan type has its features and benefits (see next page) and can be a good way to save for retirement.

RRSP

TFSA

What is the annual contribution limit?	
For 2025, the lesser of 18% of income earned in the previous year, or \$32,490. Annual limits will typically increase	For 2025, the limit is \$7,000 and is not based on earned income. Annual limits are subject to periodic increases tied to inflation rates
Can spousal contributions be made?	
Yes, but subject to specific attribution rules	Yes, but subject to specific attribution rules
Is the contribution tax-deductible?	
Yes, as contributions are made with pre-tax dollars	No, as contributions are made with after-tax dollars
Are withdrawals taxable?	
The amount that is withdrawn counts as taxable income if the withdrawal takes place before conversion to a RRIF or annuity	Since accounts are funded with after-tax dollars, no tax is payable on investment growth or withdrawals
Can contributions be carried forward?	
Contribution room can be carried forward indefinitely	Contribution room can be carried forward indefinitely
Can re-contributions be made after withdrawals?	
Only allowed under the HBP and LLP, each of which has specific re-contribution requirements	Only allowed in subsequent years after the withdrawal (i.e., not in the same year), subject to the accountholder's existing account limits
What's the potential impact on certain government benefits?	
Since RRSP withdrawals are considered income, they may be subject to clawback provisions on income-tested benefits such as GIS and OAS	No impact, since TFSA withdrawals are not considered to be income for tax purposes
Does the account ever need to be converted?	
Plan must be converted to a RRIF or annuity by the end of the year the accountholder turns 71	Plan does not need to be converted or collapsed over the lifetime of the accountholder

Saving for your child's education with RESPs

A Registered Education Savings Plan (RESP) is a special account to help parents and family members save for a child's education after high school. While anyone with a Social Insurance Number (SIN) can open an RESP account, beneficiaries must be under 21 years of age when they are added to the plan, and contributions are capped at a lifetime amount of \$50,000 per beneficiary.

Benefit from government incentives

One advantage of using an RESP to save for your child's education is that the Government of Canada offers financial incentives, including a grant that matches as much as 20% of your own annual contribution, to a maximum of \$2,500 per year. The amount and type of incentive depends on your own contribution and your family circumstances.

While you can't deduct RESP contributions from your taxes, the money in the plan will grow tax-free each year, which means more money will be available for future education costs. If you open the RESP account when your child is young, there will be many years for your contributions, applicable government grant, and interest to grow tax-free.

Investing early with RESP's

Annual investment of \$2,500 in an RESP with a 6% annual rate of return

Does not factor in Canada Education Savings Grant Program (CESG) Contribution.
For illustration purposes only. Not to be construed as investment advice.

RRIFs and SWPs for wealth decumulation

Eventually we all need to convert our retirement savings into retirement income. Typically this wealth decumulation process starts by transferring your RRSP holdings into a Registered Retirement Income Fund (RRIF) on or before December 31 of the year you turn 71. Consider the RRIF the sequel to the RRSP, but instead of making regular contributions, you make regular withdrawals based on a prescribed schedule. Like an RRSP, income from an RRIF is only taxable when withdrawn.

Using SWPs to supplement your cash needs

Another way to generate regular cash flow is through a Systematic Withdrawal Plan (SWP). With an SWP, you can withdraw a specific amount at regular intervals (e.g., \$500 per month) from a mutual fund, gradually drawing down on your investment to fund your retirement income needs.

If you don't spend all the money you receive from your RRIF and/or SWP, consider using the surplus to save in an investment vehicle like the Tax-Free Savings Account (TFSA). Should your retirement cash flow needs change in the future, you can use these additional savings to minimize retirement portfolio withdrawals.

An example of how an SWP works over 10 years

	Value (\$)	Growth (\$)	Value before SWP (\$)	SWP (\$)	Value after SWP (\$)
1	250,000	15,500	265,500	13,500	252,000
2	252,000	15,624	267,624	13,500	254,124
3	254,124	15,756	269,880	13,500	256,380
4	256,380	15,896	272,275	13,500	258,775
5	258,775	16,044	274,819	13,500	261,319
6	261,319	16,202	277,521	13,500	264,021
7	264,021	16,369	280,390	13,500	266,890
8	266,890	16,547	283,438	13,501	269,937
9	269,937	16,736	286,673	13,502	273,171
10	273,171	16,937	290,107	13,503	276,604

For illustration purposes only. The example above illustrates an investor who invests \$250,000 in a mutual fund portfolio with a consistent annualized total return of 6.2% and sets up an SWP to withdraw \$1,125 each month, or \$13,500 annually (5.5% per annum of the total initial portfolio value).

RRIF minimum withdrawal table

Age (at start of year)	Pre-March 1986	Qualifying RRIFs	All other RRIFs
71	.0526	.0526	.0528
72	.0556	.0540	.0540

What is responsible investing?

Responsible investing is a way to grow your money for the future while helping to improve society and the environment along the way. To do that effectively, investment managers consider three types of factors called environmental, social, and governance factors.

Environmental

- Innovation
- GHG emissions reduction & progressive climate policy
- Responsible water use
- Biodiversity protection
- Waste reduction

Social

- Respect human rights
- Safe and healthy workplace
- Positive impact on communities

Governance

- Independent board of directors with diverse perspectives
- Responsible tax strategy
- Anti-corruption
- Transparency

Why does responsible investing make sense?

As environmental, social and governance (ESG) best practices grow in importance worldwide, the focus of businesses has shifted to factoring ESG into their strategic plans in order to create value for shareholders. This means more promising responsible investing opportunities, and is a reason for investors to take notice and participate.

Business practices that harm people and the environment can damage company reputations, as well as investments. Responsible investing is a strategy that takes such practices into consideration and can help reduce risks that could prove costly to investors.

Responsible investing goes beyond simply screening out controversial sectors like tobacco, alcohol or gambling. It can involve a more inclusive approach that identifies companies or organizations that adopt ESG best practices, or that specifically provide a beneficial social or environmental impact, while generating a competitive financial return.
